Project idea proposal

1) Problem description:

- : After the covid-19, the world has dramatically changed and people prefer to buy things online rather than going physically.

Due to which the business model of shopping has changed and more of the stores are converting into online.

-: Most of the vendors are ready to give it a try but they don't want to take the risk of investing a high amount in their initial stage. They want to keep it lower and cost

effective so they can test whether their system is delivering what is expected. They prefer to scale it up when there is more traffic and could make it available to different regions.

2) Proposed solution:

-: Our main focus is to provide for the customer, the cost effective and reliable solution that doesn't affect the budget.

- scalability with respect to computation; when a vendor wants to add more features and when the traffic is growing to keep the response time minimum.

- scalability with respect to data; when a vendor wants to scale his business and want to add more items when users are growing and to keep the record of users.

-: We have planned to develop an e-commerce store on AWS cloud. Our

objective is to create a secure, readily and reliable website using AWS; for people who would like to try converting their physical store to online.

:-

1. Using AWS Lightsail; a virtual server that provides a platform to create numerous websites using CM'S i.e Wordpress.
2. Using CloudFront; To reduce the delay when customer requests.
3. Using Auto-scaling; to grow and shrink the website on demand.
4. Using Lambda serverless; converting HTTP requests to an event.

3) Test Plan:

:- We will test the solution by generating instances and giving many requests to the server where the website is deployed so we

can perform auto-scaling and check the response time on different zones.
